

Review

The discovery of Controlled Eosinophilic Syndrome (the development of the immunomodulator and Technology of immunotherapy) caught my attention about two decades ago. Meanwhile, in the course of scientific research in the Scientific Production System "Fertility & Ecology" and practical therapy, all developments of Andrey L. Ostanin have undergone significant change and have been greatly improved. It is noteworthy that in 2009 the drug and Technology of immunotherapy passed the federal examination in the Udmurt Republic Department of Federal Service for Consumer Rights and Health Protection. The controlled eosinophilic syndrome immunomodulator successfully passed clinical trials in the network of multidisciplinary clinics "Doctor Plus". This Technology allows to dramatically affect the human immune system, activate the hematopoietic function and eliminate a number of diseases from chronic fatigue syndrome and asthma to cancer, including its terminal stage. I went through a preventive course of immunotherapy as a patient too, and I can conclude that this drug, boosting immunity, has a positive and prolonged impact on the overall vitality and potential of the patient. I personally know a number of ex-cancer patients who achieved long-lasting remission after a course of immunotherapy in question. I recommend this paper to you without reservations: the description of the Controlled Eosinophilic Syndrome is subject to publication. That would foster world medical science and, ultimately, save lives of many people.
